The decline in total fertility rate is one of the demographic factors contributing to ageing population

Crude Death Rate

5.1 deaths per 1,000 population

Stillbirth Rate

4.9 stillbirths per 1,000 births

Under-5 Mortality Rate

7.7 deaths per 1,000 live births

Infant Mortality Rate

6.2 infant deaths per 1,000 live births

Explanatory Notes

Total Dependency Ratio refers to the number of persons under age 15 plus persons aged 65 or older per 100 persons of age 15 to 64. It is the sum of the youth dependency ratio and the old-age dependency ratio.

Youth/Young Age Dependency Ratio refers to the number of persons 0 to 14 years per 100 persons 15 to 64 years.

Old-Age Dependency Ratio refers to the number of persons 65 years and over per 100 persons 15 to 64 years.

Life Expectancy refers to the average remaining age (years) for a person is expected to live at the beginning of the certain age.

Crude Birth Rate refers to the number of live births per 1,000 population.

Crude Death Rate refers to the number of deaths per 1,000 population.

Total Fertility Rate refers to the average number of children which would be born if women survived to the end of their reproductive period and throughout that period are subject to the schedule of age-specific fertility rates for the given year. [This rate is derived by adding up the age-specific fertility rates of women aged 15-49 years (by five-year age groups) and multiplying by 5].

Stillbirth Rate refers to the number of stillbirths per 1,000 births (live births & stillbirths).

Under-5 Mortality Rate refers to the number of death of infants and toddlers under below 5 years per 1,000 live births.

Infant Mortality Rate refers to the number of death of infants aged under 1 year per 1,000 live births.

The added total may differ due to roundings.

Data for 2018 is estimate.
